Cell. Biol. 10:4795-4806(1990).
CATALYTIC ACTIVITY: N6-(L-1,3-dicarboxypropyl)-L-lysine + NAD(+)
H(2)0 = L-lysine + 2-oxoglutarate + NADH.
H(2)0 = L-lysine + 1-oxoglutarate + NADH.
PATHWAY: 8TH STEP IN LYSINE BIOSYWTHESIS.
SIMILARITY: TO OTHER FUNGAL SACCHAROPINE DEHYDROGENASE.

DOLI T., Metchaner M., Riederer B.M., Honegger P., Matus A.;

An isoform of matortubule-associated protein 2 (MAP2) containing

RT dur repeats of the tubulin-binding metif.";

J. Cell Sci. 106:633-640(1993).

J. FUNCTION: THE EXACT FUNCTION OF MAP2 IS UNKNOWN BUT MAPS MAY

SEEM TO HAVE A STIFFENING EFFECT ON MICROTUBULES.

SEEM TO HAVE A STIFFENING FPECT ON MICROTUBULES.

- ALTERNATIVE SPLICING OF THE SAME GENE. MAP2C, THE LOW MOLECULAR

ALTERNATIVE SPLICING OF THE SAME GENE. MAP2C, THE LOW MOLECULAR

C. PERCLOPMENTAL STAGE: MAP2C IS EXPRESSED DURING EMBRYONIC BRAIN

C. DEVELOPMENT AND UNTIL POSTANATAL DAY 10. MAP2B IS EXPRESSED

THROUGHOUT BRAIN DEVELOPMENT.

C. SIMILARITY: CONTAINS 3 OR 4 TAU/MAP REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kindler S., Schulz B., Goedert M., Garner C.C.; "Molecular structure of microtubule-associated protein 2b and 2c from

Submitted (JUL-2000) to the EMBL/GenBank/DDBA databases.

-: PUNCTION: DYNEIN HAS ATPASE ACTIVITY. CYTOPLASMIC DYNEIN ACTS AS OFFICE FOR THE INTRACELLULAR RETROGRADE MOTILITY OF VESICLES AND ORGANIELLES ALONG MICROTUBULES.

-: SUBUNIT: CONSISTS OF AT LEAST TWO HEAVY CHAINS AND A NUMBER OF INTERMEDIATE AND LIGHT CHAINS.

-: SUBCELLULAR LOCATION: CYtoplasmic.

-: SUBCELLULAR LOCATION: CYtoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               --GLPS-----GICPIVFVFTGVGNVSQGAQEIFKLLPHTFVDAEKLPEIFQARNLSKQ

Nucleic acids and chimeric genes for increasing seed lysine content - comprise sequence encoding all or part of lysine ketoglutarate reductase, useful to improve nutritional quality of seeds from transformed plants

Claim 3; Page 184-186; 231pp; English

This is the nuclectide sequence of a near full-length CDNA encoding carbon and a sechatory of developing seed cDNA using primers (see AAW97761), or amplification of developing seed cDNA using primers (see AAV99560-61) complification of developing seed cDNA using primers (see AAV99560-61) complification of developing seed cDNA using primers (see AAV99560-61) concleic acids comprising sequences, and by RACE. Isolated comprising sequences encoding all or part of plant concleic acids comprising sequences encoding all or part of plant concerned to a subfragment) operably linked to a seed specific regulator, where the chimeric gene reduces LKR activity in plant corruptive is reduced due to a mutation in the gene encoding LKR or activity is reduced due to a mutation in the gene encoding LKR or cransformation with the chimeric gene; (3) a nucleic acid fragment comprising (1) chimeric gene above, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dipydrodipicolinic acid in which a nucleic acid fragment encoding dipydrodipicolinic acid comprising (1) chimeric gene above, and (ii) a second chimeric gene, comprising in plant seed-specific regulatory sequence; (4) plants comprising in plant seed-specific regulatory sequence; (4) plants comprising in genome (1) and (ii), especially as fragment of (2); and (5) seeds con (2); and (2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A A
```

This is the nucleotide sequence of a truncated cDNA encoding a maize lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDN) polypeptide (see AAMR7762). Isolated nucleic acid fragments comprising sequences encoding all or part of plant LKRs are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific requilator, where the chimeric gene reduces LKR activity in plant seds transformed with it; (2) plant cells and seeds in which LKR seds transformed with the chimeric gene; (3) a nucleic acid fragment comprising: (i) chimeric gene above, and (ii) a second chimeric gene, comprising: (i) chimeric gene above, and (ii) a second chimeric gene, comprising: (i) chimeric gene above, and (ii) a second chimeric gene, synthase (BHDFS) substantially insensitive to lysine inhibition is operably linked to a plant chlorophast transit sequence and to a synthase (bHDFS) substantially as fragment of (2); and (5) seeds of from (3). The chimeric genes can be used to produce plant cells corn, soybean, rapeseed, wheat and rice (claimed). LKR is corn, soybean, rapeseed, wheat and rice (claimed). LKR is corn, soybean, rapeseed, wheat and rice (claimed). LKR is corn, soybean, rapeseed, wheat and rice (claimed). LKR activity reduction may be achieved by cloning the claimed corn, preparing a chimeric gene for cosuppression of LKR, the chimeric gene for LKR, and transforming plants with the chimeric gene. Nucleic acids and chimeric genes for increasing seed lysine conte-comprise sequence encoding all or part of lysine ketoglutarate reductase, useful to improve nutritional quality of seeds from Claim 3; Page 192-193; 231pp; English McDevitt sc, WPI; 1999-045139/04. P-PSDB; AAW87762. Falco transformed plants

```
This is the nucleotide sequence of a near full-length cDNA encoding coopbean lysine ketoglutarate reductase (LKR, see AAN87760), or saccharopine dehydrogenase (SDH). It was obtained by PCR saccharopine dehydrogenase (SDH). It was obtained by PCR saccharopine developing seed cDNA using primers (see AAV99560-61) absed on Arabidopsis LKR/SDH sequences, and by RACE. Isolated nucleic acids comprising sequences, and by RACE. Isolated nucleic acids comprising sequences encoding all or part of plant critical acids comprising the critical properties of tragment (or a subfragment) operably linked to a seed specific requilator, where the chimeric gene reduces LKR activity in plant critical properties and seeds in which LKR seeds transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric gene above, and (il) a second chimeric gene, comprising; (1) chimeric gene above, and (il) a second chimeric gene, comprising; (1) chimeric gene above, and (il) a second chimeric gene, synthase (PHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chloroplast transit sequence and to a operably linked to a plant chloroplast transit sequence and to a operably linked to a plant chloroplast transit sequence and to a corn, soybean, rapeseed, wheat and rice (Claimed). LKR is corn, soybean, rapeseed, wheat and rice (claimed). LKR activity, sepecially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR activity reducent and rice (claimed). LKR activity reducent and rice (claimed). LKR activity preparing a chimeric gene. TKR, and transforming plants with the chimeric gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids and chimeric genes for increasing seed lysine content - comprise sequence encoding all or part of lysine ketoglutarate reductase, useful to improve nutritional quality of seeds from transformed plants
                                                                                                                                                                                                                                                                         Lysine ketoglutarate reductase; saccharopine dehydrogenase;

acid fragments comprising sequences encoding all or part of plant in KRs are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific requiator. Where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR cactivity is reduced due to a mutation in the gene encoding LKR or comprising: (1) chimeric gene; (3) a nucleic acid fragment comprising: (1) chimeric gene; (3) a nucleic acid fragment comprising: (1) chimeric gene above, and (ii) a second chimeric gene, comprising: (1) chimeric gene above, and (ii) a second chimeric gene, operably linked to a plant chloroplast transit sequence and to a synthase (plups) substantially insensitive to lysine inhibition is operably linked to a plant chloroplast transit sequence and to a sequence; (4) plants comprising in plant seed-specific regulatory sequence; (4) plants comprising in genome (1). The chimeric genes can be used to produce plant cells of from (3). The chimeric genes can be used to produce plant seeds. The chimeric genes can be used to produce plant seeds. If montant in controlling free lysine accumulation in plant seeds. If ragment, preparing a chimeric gene accumulation in plant seeds. If ragment, preparing a chimeric gene (1) crosuppression of LKR. ctivity reduced LKR, and transforming plants with controlling tenes of the chimeric gene.

This nucleotide sequence of a coding region for an Arabidopsis thaliana polypeptide (see AAW87766) comprising the saccharopine thaliana polypeptide (see AAW87766) comprising the saccharopine dehydrogenase (SDH) domain of the lysine kercolluctarie reductase/ dehydrogenase (SDH) domain of the lysine kercolluctarie reductase/ some polymeric or action of plant LKR polypeptides are new. Also encoding all or part of plant LKR polypeptides are new. Also caption operably linked to a suitable seed specific regulator, where the chimeric gene reduces LKR activity in plant seeds where the chimeric gene reduces LKR activity in plant seeds where the chimeric gene in uncleic acid fragment cransformation with the chimeric gene; (3) a nucleic acid fragment cransformation with the chimeric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene above, and (ii) a second chimeric gene acid respond to a plant chloroplast transit sequence and to a synthase (DHDPS) substantially insensitive to lysine inhibition is synthase (DHDPS) substantially insensitive to lysine inhibition is synthase (DHDPS) substantially as fragment of (2); and (5) seeds operably linked to a plant chloroplast transit sequence and to a plant seed specific regulatory sequence; (4) plants comprising in a second chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially in Arabidopsis, and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR activity reduction may be achieved by cloning the claimed transit in controlling free lysine accumulation in plant seeds. Transity with expression of antisense RNA for LKR, and transforming plants with the chimeric gene.

dehydrogenase (SDH) polypeptide (see AAW87765). It was isolated from an expressed sequence tag database by comparison to an arabidopsis LKR/SDH protein (see AAW87769). Isolated nucleic acid fragments comprising sequences encoding all or part of plant caid fragment comprising sequences encoding all or part of plant LKRs are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific regulator, where the chimeric gene reduces LKR activity in plant regulator, where the chimeric gene reduces LKR activity in plant cells and seeds in which LKR seeds transformed with it; (2) plant cells and seeds in which LKR comprising; (i) chimeric gene above, and (ii) a second chimeric gene, comprising; (i) chimeric gene above, and (ii) a second chimeric gene, operably linked to a plant chloroplast transit sequence and to a synthase (DHDPS) substantially insensitive to lysine inhibition is synthase cheperific regulatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds transfer seds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR is corn, soybean, rapeseed, wheat and rice (claimed). LKR is is corn, soybean, rapeseed, wheat and rice (claimed). LKR is in mortant in controlling free lysine accumulation in plant seeds. The expression of LKR, and transforming plants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the chimeric gene.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ggcaatccgggattgtggctacgagatctcgcttggcatgatgcccaagtccattggacc 773
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GATAGTGTTTGTGTTCACTGGAGTTGGAAACGTCTCTCAGGGTGCGCAGGAGATATTCAA 592

```
The invention relates to invertebrate enzymes and nucleic acids, including lysine-ketoglutarate reductase/saccharopine dehydrogenase (LKR/SDH) and apetidit-alpha-hydroxyglycine alpha-amidating lyase (PAL) from Drosophila melanogaster, designated dmiKKPSDH, dmaRAL and dmpALL.

The enzymes are useful for detecting a candidate compound especially a nvertebrate enzyme or its fragment. The identified compound is useful for controlling a pest, by reducing viability of the pest. Insect or for controlling a pest, by reducing viability of the pest. Insect or invertebrate enzyme activity and for identification and screening of pesticide targets directed to components of a pathway involving esticide targets directed to components of a pathway involving of subject protein. Nucleic acids encoding the invertebrate enzymes or their creaming of subject protein. Nucleic acids encoding the invertebrate enzymes or their useful for genetically modifylm metazoan invertebrate organisms, such as insects and worms or cultured cells, resulting in expression of the protein. The organisms or cultured cells are useful or as insects and worms or cultured cells, resulting in expression of the protein. The organisms or cultured cells are useful or activity of a subject nucleic acid or protein, and thus are useful in treatment of disorders associated with abnormal components of the original protein of new drug targets, therapeutic agents, diagnostics and contained protein and the catabolism of the present sequence is Drosophila melanogaster LKR/SDH is a principal enzyme in the catabolism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ij
                                                                                                                                                                                                                                                                                                                                          Novel invertebrate enzymes and nucleic acid encoding the enzyme useful as targets for pesticides and to identify compounds that have utility as therapeutics or pesticides .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              53 GATTATTGTGCAGCCAAGCACAAGGAGGATCCATCATGACGCTCAGTATGAGGATGCAGG 112

                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2107

The present sequence encodes a protein homologous to fungal saccharopine dehydrogenases. The specification describes a Corynebacterium dapA gene, which encodes a dihydrodipicalinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean
                                                                                                                                                                                                                                                                                                                                                CDNA encoding protein homologous to fungal saccharopine dehydrogenases.
